

FieldManager Software Benefits

- Scalable to fit any size organization
- Standardizes business practices
- Accurate record keeping
- Paperless data collection
- Instantaneous status reports
- Timely contractor payments
- Significant time and cost savings
- Increased flexibility
- Access to critical information both on- and off- site
- Faster decision making
- Login security and revision tracking for comprehensive auditing
- Single-point data entry
- Standalone or network installation
- Configurable to meet your specific business needs

The FieldManager® software is an award-winning construction management system for managing and tracking construction projects. Designed for any size organization that manages construction projects, the FieldManager software wraps up contract documentation and reporting, contract modifications, and pay estimates into one neat package, increasing productivity and accountability by implementing a standard business practice across the organization.

Increasing demands and higher accountability in the construction industry require an enterprise-wide solution that offers seamless integration, ease of use and reliable support. Designed and built for users by users, the FieldManager® software provides a stable and scalable software solution to manage your construction projects.

Using field-proven methodologies, the FieldManager software reduces common errors and organizes vast amounts of construction contract data with pinpoint accuracy, streamlining the construction management process and adding clarity to all levels of communication.

The FieldManager software, along with its companion products – the FieldManager Read-Only software, the FieldBook™ software, the FieldBuilder™ software and the FieldNet™ software – works for you by offering single-point data entry, comprehensive reporting tools and configurable agency options to fit your exact business needs.

The FieldManager software acts as the main repository for your construction contracts, tracking everything from pay estimates and contract modifications to material usage and inspector daily reports.

The FieldManager Read-Only software provides anyone involved in the construction cycle, from executives to contractors, access to project data for reference and review.

For field data collection, the FieldBook software works on-site with the inspectors, providing them with critical contract data and a means to accurately capture site conditions, item usage, field personnel and equipment, and much more.

The FieldBuilder software allows organizations to independently create tailored reference lists and projects outside the boundaries of other agencies or governing authorities.

Simplify data transfers and authorizations with the FieldNet software, a secure and dependable communications network that eliminates problems associated with e-mail or disks. All requests are logged, and authorizations for pay estimates and contract modifications can be done in a flash.

The FieldManager software's reporting tools also enhance its flexibility. Not only can you access more than 70 built-in, standard reports and inquiries, but you also can use any ODBC-compliant query tool to generate customized reports. It is also fully configurable. The program lets you decide how to handle certain situations, like

quantity overrun payments, stockpiles, material insufficiencies and time charge increments, based on your specific business practices.

The FieldManager software has no practical limit to the number or size of the contracts it can manage.

With login security and revision tracking, the FieldManager software keeps audit trails on every action related to contractor pay estimates. In addition, sorting and filtering on different criteria enable you to locate specific information quickly. For example, researching site conditions for an accident that occurred three years ago takes seconds, rather than the hours that would be spent

sifting through paperwork. The FieldManager software records data only once and then transfers it to necessary locations, thus eliminating the need to write down information multiple times and preventing common data entry errors. Extensive edits and warnings are built into the system to ensure that fields are filled in correctly, with minimal effort, and to provide a high degree of protection from user error.

Implement the FieldManager software and begin experiencing the many benefits of the system:

- significant time and cost savings
- substantial reduction in paperwork
- more timely project completions
- better organized projects
- increased flexibility and accuracy
- faster decision making
- improved customer response time
- faster generation of pay estimates
- increased access to contract information

Our support team provides exceptional and timely assistance. Reach us however it's convenient for you - by email, online web form or phone. Your problem will be addressed immediately by an experienced, hands-on support staff member.

FieldManager users are talking...

Managing more contracts with less staff

"With FieldManager, we can manage more contracts, for more clients per person in the field, and still maintain competitive fees. A single project manager can manage multiple contracts, and FieldManager is also adaptable to individual client's payment processes. We definitely feel that FieldManager is a differentiator for us."

*Scott Dick, USI Consultants, Inc.
Indianapolis, Indiana*

Quickly adopted by users

"Because the old system was so hard to use, we did not experience the normal resistance change. We did a day long training session with the entire staff. [Now,] we all end up doing things the same way and its easy to track what is going on. We save many man-hours in the preparation of progress payments, IDRs and even billings for reimbursable work orders, etc..."

*Bart Arthur, Clark County Department of Public Works
Clark County, Washington*

ROI: 2 days/wk, tens of thousands of dollars

"The savings in time [using FieldManager Read-Only] amounts to two days a week - minimum - saved between the project administrator and construction administrator. Cost savings in a year's time over many projects is in the tens of thousands of dollars, in my opinion."

*Ken Terveen, Barrett Paving Materials
Ypsilanti, Michigan*

Large agency saving \$28.5 million/year

"A survey of Michigan Department of Transportation offices and construction sites showed the computer program saves the state an estimated \$28.5 million a year in reduced hands-on time needed to prepare and monitor inspection reports. And that's just what we could substantiate. There are lots of other areas where this saves money that we could not document that would probably double that amount."

*Cliff Farr, Michigan Department of Transportation
Lansing, Michigan*
